Introduction to the SIL Greek Font System

Welcome to the SIL Greek Font System. We hope to provide here an integrated system for entering, displaying and printing Biblical Greek texts. Also included are fonts for transliteration and conversion programs for going from one encoding to another. We welcome your comments and hope you will contact us should you find any inconsistencies or oversights.

Three families of fonts are included in this package:

SIL Galatia—containing the basic set of characters needed for Biblical Greek texts (Regular & Bold faces)

SIL Galatia Extras—containing additional rarely used characters (Regular & Bold faces)

SIL Greek Trans—containing characters used to transliterate Greek into Roman text (Regular, Bold, Italic & Bold Italic faces)

In addition to the fonts themselves, this package includes keyboard control files for use with either the Tavultesoft Keyboard Manager® (KeyMan) for Windows or SILKey for the Mac OS. These files simplify the typing of Greek text. Users may produce their own keyboard files if desired. Conversion routines, for use with the Consistent Changes program are also included to convert texts between character encodings. KeyMan, SILKey and the Consistent Changes programs are available from SIL's Web site (www.sil.org).

For Mac OS users, the SIL Galatia font family, when used with QuickDraw GX-savvy applications, automatically combines diacritics (without the need for additional keyboarding utilities) and includes many alternate forms and additional features. A WorldScript script file that provides some of these features is also included.

Consult the *Installation Guide* and *Release Notes* for instructions on installing the system and further information, including known problems and a complete listing of the contents of this package.

Distribution

The Summer Institute of Linguistics (SIL) is an organization of linguists dedicated to the study and promotion of the thousands of languages around the world. SIL's International Publishing Services serves SIL by developing products to assist in the publication of linguistic texts.

This font system was originally developed to meet the needs and restrictions of in-house development projects, and so, may not adequately address the more generalized need for Biblical Greek computing solutions or be applicable in all situations. Nevertheless, we are happy to make this package available to the general academic community at no charge. You may (and are encouraged to) share these fonts and utilities with your friends and co-workers, but with the following restrictions:

- All files must be copied together, including this one.
- No fee may be charged for the fonts.
- They may not be used as a basis for other fonts.

Even though these fonts are freely distributable, SIL retains all copyright and ownership of the included fonts and utilities and reserves the right to restrict their use and distribution at any time. They may be placed on bulletin boards, etc. but cannot be included in (or bundled with) any commercial product including hard disks or CD-ROMs without specific written permission.

License

This is a legal agreement between you and the Summer Institute of Linguistics, Inc. (SIL) covering your use of the SIL Greek Font System. Be sure to read the following agreement before using the software. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, DO NOT USE THE SOFTWARE AND DESTROY ALL COPIES OF IT.

This copyright software is distributed as freeware. You may use this software without any charge and may distribute to others. The software is owned by SIL and is protected by United States copyright laws and international treaty provisions. Therefore, you must treat the software like any other copyrighted material (e.g. a book or musical recording).

Commercial distribution of the software is restricted without permission of SIL. If you wish to distribute this software contact SIL for details on obtaining a license.

You may not rent or lease the software, nor may you modify, adapt, translate, reverse engineer, decompile, or disassemble the software.

If you violate any part of this agreement, your right to use this software terminates automatically and you then must destroy all copies of this software in your possession.

THE SOFTWARE AND RELATED DOCUMENTATION ARE PROVIDED "AS IS" AND WITHOUT WARRANTY OF ANY KIND AND SIL EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. UNDER NO CIRCUMSTANCES SHALL SIL BE LIABLE FOR ANY INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES THAT RESULT FROM THE USE OR INABILITY TO USE THE SOFTWARE OR RELATED DOCUMENTATION, EVEN IF SIL HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

This Agreement shall be governed by the laws of the State of Texas. If for any reason a court of competent jurisdiction finds any provision of this Agreement, or portion thereof, to be unenforceable, that provision of the Agreement shall be enforced to the maximum extent permissible so as to effect the intent of the parties, and the remainder of this Agreement shall continue in full force and effect.

The software and documentation is provided with RESTRICTED RIGHTS.

Use, duplication, or disclosure by the Government is subject to restrictions as set forth in subdivision (b)(3)(ii) of The Rights in Technical Data and Computer Software clause at 252.227-7013.

Manufacturer is the Summer Institute of Linguistics, 7500 West Camp Wisdom Rd., Dallas, Texas, 75236, United States of America.

Support

As these fonts and utilities are distributed at no cost, we are unable to provide a commercial level of personal technical support. We will, however, try to resolve problems that are reported to us. We do wish to know about these problems so they can be addressed in future releases. Even if you are not having any specific problems, but have an idea on how this system could be improved, we want to hear your ideas and suggestions.

Using the Greek Keyboards

Most people have their own preferences for how they prefer to type Greek text, but many also want to be able to share texts with others. The keyboards in the SIL Greek Font System have been developed with flexibility in mind, but also aid in making resulting text consistent.

Keyboard enhancers such as KeyMan (Windows) and SILKey (Mac OS), when used with the keyboard control files included in this package, intercepts keystrokes, uses the active keyboard control file to process them, then passes the result to the operating system. This allows for multiple ways of entering the same text.

For example, one way to enter $\acute{\alpha}$ is to type the rough breathing before the vowel—“ha”. Another method is to type it after—“ah”. Both are accepted, and the result of either (when using the SIL Greek keyboard) is the code 131 ($\acute{\alpha}$).

Note that neither KeyMan nor SILKey are included in this package. They must be downloaded separately from SIL’s Web site and installed according to the documentation included in those packages. The SIL Greek Font System keyboards can then be installed using the same documentation. For more specific information on the programs and writing control files consult the KeyMan or SILKey documentation.

Keyboard Control Files

Three keyboard control files are included in this package, with an additional one for use with WorldScript on the Mac OS. Each is designed to support a specific encoding. All keyboards support the same keystroke combinations for text entry, but give text to the operating system in their specific encodings. See the next chapter for more information on encodings and their use.

SIL Greek Keyboard

Mac OS file: SIL Greek kbd
Windows files: SILGREEK.KMN, ALPHA0.BMP, ALPHA1.BMP

The SIL Greek keyboard is designed for entering text into the SIL Composite Greek encoding—the encoding most likely to be used by most Windows and Mac OS users.

SIL Basic Greek Keyboard

Mac OS file: SIL Basic Greek kbd
Windows files: BASGREEK.KMN, BETA0.BMP, BETA1.BMP

The SIL Basic Greek keyboard is designed for entering text into the SIL Basic Greek encoding—the encoding most suitable for cross-platform file sharing and that used with WorldScript and QuickDraw GX.

SIL Greek Transliteration Keyboard

Mac OS file: SIL Greek Transliteration kbd
 Windows files: GREEKTRN.KMN, OMEGA0.BMP, OMEGA1.BMP

The SIL Greek Transliteration keyboard is designed for entering text into the SIL Greek Transliteration encoding for display with the SIL Greek Trans font.

SIL Basic Greek (WS) Keyboard

Mac OS file: SIL Basic Greek (WS) kbd

The SIL Basic Greek (WS) keyboard (only on the Mac OS) is identical to the SIL Basic Greek keyboard, except that it is linked to the WorldScript keyboard system, so that it can be automatically activated whenever a Greek font is chosen. See the chapter on WorldScript for more information.

Keyboard Assignments

The main purpose of the keyboards is to provide a wide range of keying options, so many characters can be entered in multiple ways. If you are typing and make a mistake and use the backspace key to delete characters, the keyboard remembers the context.

Letters

α	β	γ	δ	ε	ζ	η	θ	ι	κ	λ	μ	ν	ξ
a	b	g	d	e	z	j, e=, e~ or e^	q or th	i	k	l	m	n	x

ο	π	ρ	σ,ς	τ	υ	φ	χ	ψ	ω
o	p	r	s	t	u	f or ph	c, ch or kh	y or ps	w, o=, o~ or o^

The keyboard automatically chooses the correct code for the *sigma* depending upon the encoding and the context, so the correct final form is used when appropriate.

γγ	γκ	γξ	γχ
ngg	nk	nx	nc(h)

When *gamma* occurs before another *gamma*, it can be typed as **ng**, meaning that ἄγγελος can be typed **angellos**. When *gamma* occurs before *kappa*, *xi* or *chi*, it can be typed as **n**. Note that **ng** alone produces νγ, as in μενοινγε.

Diacritics

acute	circumflex	grave	alpha	iota
' or /	^, ~ or =	` or \	!, , + or _	"

Diacritics are usually typed after vowels, but may also be typed before word-initial vowels and should be typed before uppercase letters. They can be combined in any order. If you accidentally type the wrong diacritic, you can change it by typing the correct one immediately.

Breath Marks

smooth	rough
>	h or <

A smooth breathing is automatically added to a word-initial vowel and a rough breathing to a word-initial *rho*. To get a rough breathing on an initial vowel, type **h**—**huper** for ὑπερ, for example. If you type a word that is all uppercase, the initial breathing mark is automatically removed.

Like other diacritics, they are usually typed after vowels, but may be typed before word-initial vowels. They can also be combined with other diacritics by typing them in any order after the base character. If you type a diphthong, any breath marks and accents on the first vowel are correctly moved to the second vowel.

For example, to type Οὐκ εἰμι ἐγὼ ὁ Χριστός. (ΙΩΑΝΝΗΝ 3:28) you only need to press the following keys:

**O u k SPACE e i m i SPACE e g w SPACE h o SPACE
C r i s t o s PERIOD SPACE (I W A N N J N SPACE 3 : 2 8)**

You can also press ***** to remove the breathing mark from a vowel or rho.

In a few words, a vowel with *dieresis* follows an accented vowel. You will need to type **@** before the vowel with *dieresis* to get the right behavior. For example, to get Ἰάϊρος, type **la/@i"ros**.

Punctuation

,	.	.	;	'
,	.	:	; or ?	'

To type an apostrophe following a vowel (as in δι' αὐτοῦ) press the quote key twice.

Other Characters

The following characters are available for typing directly:

&	()	-	0 ... 9	[]	{	}
---	---	---	---	---------	---	---	---	---

Others can be typed by preceding them with @ (the @ produces •):

!	«	»	*	+	— EM-DASH	— EN-DASH
@!	@(@)	@*	@+	@~	@-

/	:	<	=	>	\
@/	@:	@<	@=	@>	@br %

Modifier

When using the SIL Basic Greek or SIL Basic Greek (WS) keyboards, an additional key sequence is available for entering the “modifier” code (124). This is used to access additional glyphs normally not available without the use of WorldScript or GX. See the chapters on WorldScript and GX for more information.

MOD MODIFIER
@@

Working with Encodings

Two Greek Text Encodings

Greek texts that have been prepared with these Greek fonts in mind (or entered using the SIL Basic Greek or SIL Greek keyboards) will be in one of two text *encodings*: **SIL Basic Greek** or **SIL Composite Greek**. An *encoding* is simply a way of connecting numeric access codes stored in a text file with the individual characters they should represent. For example, an *alpha* may be encoded (represented) as 097 in the text file. If the computer program understands that encoding it knows to process code 097 as an *alpha*, and treat it appropriately.

One of the requirements for this font system was to have encodings that met the needs for linguistic analysis while allowing text to be easily displayed in most Windows and Mac OS applications. It was also important that the text be easily read without any Greek fonts installed, allowing for easy use in purely text-based systems. Finally, each encoding needed to unambiguously encode the text.

Each of the SIL Greek encodings allows for the complete, unambiguous representation of most Biblical Greek texts. The SIL Basic Greek encoding treats text as a string of linguistic information, so individual “pieces” of the text are not just symbols, but stand for individual phonological elements. This allows for easy linguistic analysis and data transfer across computer platforms and communications networks. In other words, a *sigma* is always a *sigma* and has only one code—115.

In contrast, the SIL Composite Greek encoding treats text as a string of symbols with no inherent ordering or meaning. This allows for professional-looking documents, but makes document transfer (between computer platforms and over email systems) and linguistic analysis difficult. In the case of *sigma*, there are two *sigmas*, regular and final, that must be considered when searching texts. But because each encoding is unambiguous and similarly complete, texts can be converted between encodings without any loss of information.

For another illustration of the difference between the two encodings, take the example of the α (*alpha-rough-acute*). In the SIL Basic Greek encoding this is encoded as three codes in sequence — *rough breathing* + *alpha* + *acute* — since the rough breathing denotes an initial “h” sound that precedes the vowel:

$$\alpha = \overset{\text{ˆ}}{\text{}} + \alpha + \text{ˆ}$$

104 097 039

Computer software (such as WorldScript) that can directly display SIL Basic Greek encoded text takes care of combining the three codes into one symbol on the screen.

In the SIL Composite Greek encoding the same combination of symbols would be represented by one code — *alpha-rough-acute*:

$$\alpha = \alpha$$

132

We recognize that these encodings do not address the full range of encoding needs for Greek text, and do not include some common ancient Greek symbols. As operating systems improve, and we see more widespread use of Unicode and “smart” font technologies, we hope to incorporate support for a wider body of symbols, textual conventions and new or improved encodings. For a preview of what some of this support could offer, see the chapters on WorldScript and QuickDraw GX. Please help us as we look toward improving this font system. We value your expertise and recommendations!

SIL Basic Greek Encoding

Whenever possible, Greek texts should be stored in the SIL Basic Greek encoding. This encoding was developed in order to provide an error-resistant, long-term, platform- and technology-independent method of representing the features of Biblical Greek texts. It is used directly with WorldScript and QuickDraw GX on the Mac OS, but is also useful in other environments when preparing a body of text for wide distribution or long-term use.

Features

- 1) It is a 7-bit (ASCII-like) encoding. This assures that no character translation will occur when transporting text between platforms or applications. Its simplicity also increases the overall quality of texts passing through multiple stages of text-processing by reducing potential errors introduced in data entry or conversion.
- 2) The encoded text is recognizable even if no Greek fonts are available. Greek characters are given the same access codes as similar ASCII characters (*alpha*=097=*a*, *rough breathing*=104=*h*). An example:

Ἐν ἀρχῇ ἦν ὁ λόγος

HEn Harcj_ ^ Hj^ n ho lo'gos

- 3) Text can be entered from any standard keyboard on any platform, without using additional keyboarding utilities such as KeyMan or SILKey, although these utilities will simplify data entry.
- 4) The order of codes allows for easier linguistic study and analysis. For example, the word ἦν appears in Greek texts in two very different representations:

ἦν (normal)

ἦν (sentence-initial)

Comp 218(*eta-smooth-circ*)+110(*nu*)

175(*smooth-circ*)+074(*Eta*)+110(*nu*)

Basic 072(*smooth*)+106(*eta*)+094(*circ*)+110(*nu*)

072(*smooth*)+074(*Eta*)+094(*circ*)+110(*nu*)

According to the SIL Composite Greek encoding, there are significant changes between the encodings for the normal word and its sentence-initial form—even

the order of codes is different! According to the SIL Basic Greek encoding, the only difference is the capitalization of *eta*. This allows the text to be easily searched using standard searching routines that ignore capitalization differences.

Another example: To search for every occurrence of lowercase *alpha* in SIL Composite Greek encoded text requires searching for 24 separate codes (097, 128-149, 152), whereas searching through SIL Basic Greek encoded text requires looking for only a single code (097).

Details

A listing of the access codes used in the SIL Basic Greek encoding and the characters they represent is given in Appendix A. There is, however, a very precise ordering of base characters and diacritics that must be followed to assure that the text works in systems that use the encoding directly and can be correctly converted to other encodings.

Most ordering issues in Biblical Greek center around vowel-diacritic combinations. These combinations are one of four types:

1) *Single-vowel without dieresis*

(breathing) vowel (iota subscript) (accent)

Single-vowel combinations without *dieresis* begin with an optional breathing mark (*rough* or *smooth*), followed by the vowel, an optional *iota subscript* (only when the vowel is *alpha*, *eta* or *omega*), and an optional accent (*acute*, *grave* or *circumflex*). Note that when both *iota subscript* and accent are present the *iota subscript* always comes first. An example:

$$\hat{\alpha} = \text{rough} + \alpha + \text{iota subscript} + \text{acute}$$

2) *Single-vowel with dieresis*

vowel dieresis (accent)

Single-vowel combinations with *dieresis* begin with a vowel (*iota* or *upsilon*), followed by a *dieresis* and an optional accent (*acute*, *grave* or *circumflex*). An example:

$$\ddot{\upsilon} = \upsilon + \text{dieresis} + \text{acute}$$

3) *Diphthongs*

A combination of two vowels is considered a diphthong only if it is one of these eight combinations and the latter vowel is not followed by a *dieresis*:

$\alpha\epsilon, \epsilon\iota, \omicron\iota, \upsilon\iota, \alpha\upsilon, \epsilon\upsilon, \eta\upsilon, \omicron\upsilon$

These diphthong combinations follow the following ordering:

(breathing) diphthong (accent)

They begin with an optional breathing mark (*rough* or *smooth*), followed by both vowels and an optional accent (*acute*, *grave* or *circumflex*). An example:

$$\hat{\alpha\upsilon} = \text{rough} + \alpha + \upsilon + \text{acute}$$

4) Other Multiple-vowel

Multiple vowel combinations that do not form diphthongs are treated as a sequence of single vowel combinations. An example:

$$\begin{aligned}\text{Ἰᾶϊρος} &= \text{'I} + \text{á} + \text{ï} + \text{ρ} + \text{o} + \text{σ} \\ &= \text{' + I + α + ' + ι + `` + ρ + o + σ}\end{aligned}$$

There are linguistic factors behind this ordering. Breathing (or lack of it) precedes the vowel in spoken Greek and is written before it in the case of capitalized vowels (note that the above ordering conventions are used even when a vowel is capitalized). Some theorists believe that the accents originally signified tone, which was distributed over the whole vowel combination and hence is a final modifier for everything.

The only other ordering issue concerns the *rho*. As with the vowels, the breathing marks are always encoded first.

Extensions

In order to support additional glyphs available with WorldScript and QuickDraw GX on the Mac OS, a tentative set of extensions have been made to the SIL Basic Greek encoding. Most of these extensions involve the use of the “modifier” code (124) as an escape code that changes the meaning of the following character. For example, the code sequence “|P” (124+102) is used to specify a *digamma* in a string of text. For a complete list of these extensions see the chapter on WorldScript.

Warning: This extension is currently only supported for use with WorldScript or GX. Text including these extensions cannot be accurately converted to the SIL Greek Transliteration or SIL Composite Greek encodings (as there are no access codes for the extended glyphs). The extensions are also tentative and subject to future changes.

We are actively seeking recommendations and opinions on how this type of extended encoding could be used in other parts of this font system. We need ideas on what glyphs should be supported, how they should be encoded, typed and displayed, and how they should be incorporated throughout the system.

Note on use of the SIL Galatia Extras fonts

The additional glyphs available with WorldScript are also available to Windows and other Mac OS users, but with a warning. The SIL Galatia Extras font family includes these additional symbols. *Use of these additional fonts, however, will result in text that matches neither Basic nor Composite encoding and requires character by character font information for correct interpretation and display.* Appendix E lists the extra symbols available in these fonts and their access codes.

In other words, you must switch to the SIL Galatia Extras font when you want to use one of these glyphs, then switch back to the SIL Galatia font for the common Greek glyphs. Text that includes these extra glyphs (and the resultant font change information) cannot be easily converted to either encoding and is not supported throughout this font system.

SIL Composite Greek Encoding

The SIL Composite Greek encoding was prepared to enable easy preparation of professional-looking documents using existing Windows and Mac OS operating systems and applications.

Features

- 1) It is an 8-bit (ANSI- or Mac-like) encoding. This means that it is easily used on either Mac OS or Windows, but causes problems when trying to transfer text across platforms. It also causes text to be unintelligible if viewed without the Greek font installed. Finally, some older software packages also do not support the use of ANSI or Mac font encodings (such as earlier versions of Ventura Publisher).
- 2) Lowercase vowel/diacritic combinations are represented with one access code per combination. Applications do not require special rendering systems (such as WorldScript) to correctly display combinations. This makes the encoding more practical for many users and allows the fonts to be used in any Mac OS or Windows application.
- 3) Diacritics and base characters are expertly combined and aligned into composite glyphs. Non-spacing diacritics are not used. This assures that published text is of the highest quality. It also avoids incompatibilities between the use of non-spacing/overstriking diacritics and some Windows video drivers.
- 4) Lowercase *sigma* has two access codes: word-final (118) and non-final (115). Neither Windows or the Mac OS have the native capability to contextually display the correct symbol without the use of additional rendering systems.
- 5) Use of an additional keyboarding utility, such as KeyMan or SILKey, is highly recommended for efficient and accurate data entry. This is due to the use of many more access codes than are easily accessible from standard keyboards.

Details

A listing of the access codes used in the SIL Composite Greek encoding and the characters they represent is given in Appendix B. Codes are ordered as the corresponding symbols would appear in Greek printed text, going from left-to-right. Diacritics, such as breathings, *iota subscripts* and accents have their own distinct codes only when used alone, such as before a capitalized vowel.

Converting Between SIL Greek Encodings

A set of conversion routines for use with the Consistent Changes program (available from SIL's Web site) are provided with this font system. These make it easy to convert texts between encodings. See the chapter on Text Conversions for more information.

Using the Fonts With WorldScript

A WorldScript script file (SIL Greek) and an additional Greek font (SIL Sparta) are included in the Mac OS distribution of this package. Using these with a WorldScript-aware application adds a number of new features to the font system.

Installing the WorldScript Resources

To use the WorldScript resources, you need to have the WorldScript extension installed in your System (it belongs in the “Extensions” folder within your System Folder). If you are using a PowerMacintosh or other PowerPC-based computer, and are using System 7.6.1 or earlier, you also need the WorldScript Power Adapter extension. These extensions can be installed using the Custom Install option in the Installer for Mac OS versions 7.5.3 and later. They are also provided with some of Apple’s Language Kits and Language Kit Updaters (available from Apple’s web site).

Once the WorldScript extensions are installed (and you have restarted) you can continue by installing the SIL Greek resources. Open the “WorldScript” folder inside the “SIL Greek Font System” folder and drag the “SIL Greek” script file and the “SIL Sparta” font onto the icon of your closed System Folder. The font will be placed in the “Fonts” folder and the script file will be placed in the System file itself. You will need to restart your Mac after installation.

Note: Applications that are not fully WorldScript-aware (such as Microsoft Word) may exhibit strange behavior while editing Greek text when the SIL Greek resources are active.

Encoding Issues

The WorldScript script file takes text in the SIL Basic Greek encoding and automatically combines vowels and diacritics for printing and screen display. This makes text analysis easier and makes it possible to easily enter text without the use of SILKey (although SILKey will make data entry more forgiving of mistakes). It also means, however, that text prepared with WorldScript in mind will not display correctly outside of WS-aware or GX-savvy applications unless the text is first converted to the SIL Composite Greek encoding. See the chapter on encodings for more information.

Another benefit of using the WorldScript script file is the ability to access additional glyphs that are otherwise not supported. A set of extensions to the SIL Basic Greek encoding allow access to these glyphs through the use of the modifier code (124). These additional glyphs, as well as five additional diacritic combinations, are listed here with the character sequences used to access them.

Warning: These additional glyphs are only supported for use with WorldScript or GX. Text including these extensions cannot be accurately converted to the SIL Greek Transliteration or SIL Composite Greek encodings (as there are no access codes for the extended glyphs). They are also tentative and subject to future changes.

Glyph	Name	Sequence	Notes
ι̇	iota smooth grave	Hi`	rare diacritic combination
ε̇	epsilon smooth grave	He`	rare diacritic combination
¨	dieresis circumflex	"^	rare diacritic combination
ϊ	iota dieresis circumflex	i"^^	rare diacritic combination
ϋ	upsilon dieresis circumflex	u"^^	rare diacritic combination
β	curled beta	b	archaic letter
ϝ	digamma	f	archaic letter, used in some biblical texts
Ɔ	Digamma	G	archaic letter
Ɔ	alt digamma	g	alternate form
ω	omega pi	w	archaic letter
Ϟ	qoppa	q	archaic letter
Ϡ	Qoppa	Q	archaic letter
ϡ	alt 1 Qoppa	R	alternate form
ϣ	alt 2 qoppa	k	alternate form
ϣ	alt 2 Qoppa	K	alternate form
ϥ	sampi	p	archaic letter
Ϧ	Sampi	P	archaic letter
ϧ	alt sampi	m	alternate form
Ϩ	alt Sampi	M	alternate form
Ϫ	lunate sigma	s	archaic letter
ϫ	lunate Sigma	S	archaic letter
Ϭ	stigma	t	archaic letter
ϭ	Stigma	T	archaic letter
Ϯ	turned iota circumflex	i	archaic letter
ϯ	Upsilon hook	U	archaic letter
´	upper num sign	h	used for the Greek numeral system
˘	lower num sign	H	used for the Greek numeral system
	no width letter	n	can be used to make a final sigma use non-final form
	no width space	#	can be used to make a medial sigma use final form

When WorldScript and the SIL Greek resources are active, each of the glyphs above will automatically be substituted for the character sequence listed. Note that this is not necessarily a keying sequence, but rather a character code sequence.

Entering Text

After you have WorldScript and the SIL Greek WorldScript resources installed, keyboards will work slightly differently. WorldScript provides its own keyboard management that is different from SILKey, but the two actually work quite well together.

Using WorldScript keyboards without SILKey

You do not need to use SILKey to enter Greek text. In your WorldScript-aware application, simply choose one of the SIL Greek fonts and the active keyboard will automatically be changed to the one listed as “Ελληνική” in the Keyboard menu.

The Keyboard menu (in the upper right corner of the menu bar) also allows you to manually switch between keyboards and gives a constant display of the currently active keyboard. Unless you have installed one of Apple’s Language Kits, this menu probably does not appear on your menu bar—it has to be activated separately.

Even if you are not using SILKey, you can use Weaver, the editor supplied with SILKey, to turn on the Keyboard menu even if no Language Kits or other WorldScript resources are installed. Double-click on the Weaver application icon. Choose “Preferences...” from the “Edit” menu and check the “Always show keyboard menu” option. You will need to restart your machine for the change to take effect.

WorldScript keyboards, unlike SILKey, do not perform complex processing of keystrokes. Characters must be entered exactly in the order the encoding requires. In this case, this means that keys must be pressed exactly in the order specified in the SIL Basic Greek encoding. *Note: If you are running SILKey, but wish to use this text entry method, be sure the SIL Basic Greek (WS) keyboard is deactivated.*

For example, to enter the WorldScript modifier key (the first character in most of the sequences listed above) without using SILKey, type the “|” key.

Using the SILKey keyboards with WorldScript

The WorldScript keyboard requires a very specific typing order. SILKey offers a much more flexible text entry system than using the WS keyboard alone. SILKey does not replace the WS keyboard, but works with it.

Each SILKey keyboard is “linked” to a specific Mac OS keyboard. Most of the Greek keyboards in this font system are linked to the “U.S.” keyboard so that they can work without WorldScript installed. This also means, however, that the SIL Basic Greek (non-WorldScript) and SIL Greek SILKey keyboards will not be active if the Greek fonts are in use (as using the fonts automatically specifies the “Ελληνική” WS keyboard).

A special SILKey keyboard file “SIL Basic Greek (WS)” is provided with this package. This keyboard functions the same way as the other SIL Basic Greek keyboard, but is linked to the “Ελληνική” keyboard, so that it is automatically activated whenever the WS keyboard is active (as long as the SIL Basic Greek (WS) keyboard is turned on in SILKey).

Although this keyboard makes most common Greek text entry easier, it can make other entry more complicated. For example, the “|” key used to type the modifier when SILKey is not active is used as an alternate way of typing the *iota subscript* with the SIL Basic Greek (WS) keyboard. To enter the modifier type @@.

Preparing SIL Composite Greek text

There is no WorldScript-specific version of the SIL Greek keyboard. If you must prepare texts in the SIL Composite Greek encoding while the WorldScript resources are installed, you can either 1) enter the text first in the SIL Basic Greek encoding then use the provided conversion routines to convert the text to SIL Composite Greek encoding, or 2) type the text in a Roman font (such as Times) using the SIL Greek SILKey keyboard (which is linked to the U.S. keyboard), then select the text and change to the SIL Galatia font to check your work. Be aware, however, that if you then edit that text without first switching back to a Roman font, your edits will be in the wrong encoding (Basic).

SIL Sparta

An additional Greek font—SIL Sparta—is included for use only with the WorldScript script file. It is a bitmap-only font, so is unsuitable for printing, but is used in certain system locations such as the Keyboards menu. There are also four glyphs that are not available in this font: *alt 2 qoppa*, *alt 2 Qoppa*, *alt sampi*, *alt Sampi*.

Removing the WorldScript Resources

Should you later wish to remove the SIL Greek script file and the SIL Sparta font, follow this procedure:

- 1) Restart your computer with Extensions off by holding down the Shift key throughout the startup process (neither the script file or font can be removed while the script is active).
- 2) Double-click on the System file within your System Folder. The file will open and show the “SIL Greek” script file. Drag the “SIL Greek” script file to the trash.
- 3) Close the System file and open the “Fonts” folder inside your System Folder. Find the SIL Sparta font suitcase and drag it to the trash.
- 4) Close your System Folder and empty the trash.
- 5) Restart your computer.

WorldScript-Aware Applications

The automatic features of the WorldScript script file are only available within WorldScript-aware applications. The following applications are WS-aware, but some of them vary in the completeness of their support.

Word Processing

- SimpleText, from Apple Computer, Inc.
- WorldWrite, from World Software, Inc.
- Nisus Writer (with Language Key), from Nisus Software, Inc.
- WinText, from WinSoft, S.A.

- Style, by Marco Piovaneli

Database

- Shoebox, from SIL
- HyperCard, from Apple Computer, Inc.
- 4D International from ACI
- WinFile, from WinSoft, S.A.

Page Layout

- UniQorn, from SoftPress
- Ready, Set, Go! GX International, from Diwan
- PageMaker ME, from Adobe Corp. (distributed by WinSoft, S.A.)
- AllPage, from World Software, Inc.

Specialty

- Translator's Assistant, from SIL
- TextUtils, from SIL
- Conc, from SIL

Using the Fonts with QuickDraw GX

The SIL Galatia fonts have a number of additional features when used on the Macintosh in conjunction with QuickDraw GX and an GX-based application. These include case transformations, showing/hiding accents, alternate forms for many glyphs and handling of traditional Greek numerals. There are over 430 glyphs available.

These features automatically become available when QuickDraw GX is installed and active. QuickDraw GX is an install option for systems 7.5.x and 7.6.x, but is also available on Apple's web site. The full QuickDraw GX system is not available in Mac OS 8, but a portion of it—the GXGraphics extension—remains, allowing the additional font features to still be used. In both cases, though, these features will only be available within GX-based applications.

Encoding Issues

Like WorldScript, GX takes text in the SIL Basic Greek encoding and automatically combines vowels and diacritics for printing and screen display. It also means, however, that text prepared with GX in mind will not display correctly outside of GX-savvy applications unless the text is first converted to the SIL Composite Greek encoding. See the chapter on encodings for more information.

Unlike WorldScript, accessing additional glyphs does not require a change in the underlying encodings. Most alternate glyphs are accessed by turning font features on and off, not by changing the character codes. An exception to this is the built-in support for the additional glyphs provided for WorldScript. If you use these additional character code sequences be aware of the warnings on their use as mentioned in the chapter on WorldScript.

Entering Text

GX does not require a specific text entry mechanism—it only requires that the entered text be in the SIL Basic Greek encoding. This can be accomplished using the SIL Basic Greek keyboard, the SIL Basic Greek (WS) keyboard, or manually, without any use of SILKey. Consult the chapter on Keyboards for more information.

Setting Font Features

The additional glyphs available when using the fonts with GX are accessed through setting the font features for a specific body of text. Each GX application has a different interface for controlling these features, but they all will display the same list of features.

The general method is to select the desired text then choose the variety of feature settings that should apply to the text. This is often best done through a styles mechanism—setting the desired features for each style so it can be automatically applied to the right portions of the text.

The features are organized into groups of related styles. Some sets of features are exclusive (such as Letter Case), meaning that only one setting within a group can be active at a time, while others are cumulative (such as Alternate Forms). If there is a default feature setting it is listed in *italic*.

Note again that none of these features change the underlying text.

Features Enabled

This setting is normally on—turning it off will display the text without any of the GX features active, even the defaults.

Letter Case

These features allow text to be displayed in varying cases—only one can be active at a time for a specific run of text.

Feature Name	Displays	As
<i>Upper & Lower Case</i>	text with other case features on	text without other case features
All Caps	᾽Εν ἀρχῇ	EN APXH
All Lower Case	᾽Εν ἀρχῇ	ἐν ἀρχῇ
All Caps with Accents	᾽Εν ἀρχῇ	᾽EN ᾽APXHˆ

Diacritics

This feature will either show or hide all accents (including breathings and *iota subscript*)—only one can be active at a time for a specific run of text.

Feature Name	Displays	As
<i>Show Accents</i>	text with Hide Accents on	text with all accents
Hide Accents	᾽Εν ἀρχῇ	Εν αρχη

Diacritic Alternatives

These features turn on alternate methods of displaying diacritics and can be combined—none are on by default.

Feature Name	Displays	As
Circumflex as Tilde	᾽Εν ἀρχῇ	᾽Εν ἀρχῃ̃
Show Dieresis above Uppercase	ΙΑΙ΄ΡΟΣ	ΙΑΪΡΟΣ
Monotonic Accents	᾽Εν ἀρχῇ ... λόγος	Εν αρχή ... λόγος

Alternate Forms

These features turn on alternate methods of displaying glyphs and can be combined—none are on by default.

Note that some alternate glyphs have two methods for display. For example, the *curled beta* (β) can be displayed either by entering **b**, selecting it and turning the Curled Beta feature on, or by entering the sequence **|b (@@b** if using the SIL Basic

Greek (WS) keyboard), selecting it and turning on Use Modifier. The latter method allows special glyphs to be encoded into the text as when using WorldScript.

Feature Name	Displays	As
Use Modifier	⌘β ⌘Υ υ̂	β Υ ð
Alternate Epsilon	θεός	θεός
Alternate Phi	φῶς	φῶς
Alternate Theta	θεός	θεός
Alternate Rho	κύριος	κύριος
Alternate Kappa	κύριος	κύριος
Lunate Sigma	σοφία	σοφία
F-like Digamma	Ϝ	f
Rho-like Qoppa	Ϟ	ϟ
Zigzag Qoppa	Ϡ ϡ	ϣ ϣ
Round Sampi	Ϡ ϡ	ϣ ϣ
Curled Beta	β	β
Omega-like Pi	π	ω

Numeral Forms

These features allow standard Arabic numerals to be displayed in the ancient Greek numbering system, and vice versa. The *upper num sign* (') and *lower num sign* (,) are displayed by the sequences |h and |H, respectively (@@hand @@H when using the SIL Basic Greek (WS) keyboard). The system supports transformations up to 9,999.

Feature Name	Displays	As
Show Arabic Numerals as Greek	1 2 3 4 5 6 7 8 9 10 20 30 40 50 60 70 80 90 100 200 300 400 500 600 700 800 900 1000 2000 3000 4000 5000 6000 7000 8000 9000	α' β' γ' δ' ε' Ϟ' ζ' η' θ' ι' κ' λ' μ' ν' ξ' ο' π' Ϡ' ρ' σ' τ' υ' φ' χ' ψ' ω' ϡ' ,α ,β ,γ ,δ ,ε ,Ϟ ,ζ ,η ,θ
Show Greek Numerals as Arabic	α' β' γ' δ' ε' Ϟ' ζ' η' θ' ι' κ' λ' μ' ν' ξ' ο' π' Ϡ' ρ' σ' τ' υ' φ' χ' ψ' ω' ϡ' ,α ,β ,γ ,δ ,ε ,Ϟ ,ζ ,η ,θ	1 2 3 4 5 6 7 8 9 10 20 30 40 50 60 70 80 90 100 200 300 400 500 600 700 800 900 1000 2000 3000 4000 5000 6000 7000 8000 9000

Direct Glyph Access

It is also possible to display glyphs by entering their individual glyph codes. A listing of every glyph in the SIL Galatia font and their glyph codes can be found in Appendix F.

To use Direct Glyph Access, enter a backslash (code 092) followed by the glyph code, then select the code (and the backslash) and turn the Direct Glyph Access feature on. To enter the backslash when using the SILKey keyboards type `@\`. *Note that using this feature will make the text non-standard and unconvertable to either Basic or Composite encodings.*

GX-Savvy Applications

The transformation features of the SIL Galatia font are only available within GX-savvy applications. A few of these applications are listed here—some require the full QuickDraw GX system (System 7.5.x, 7.6.x) and others only the GXGraphics extension (System 7.6.x and Mac OS 8.x).

- TeXgX, from SIL
- Creator 2, from Multi-Ad Services
- UniQorn and Freeway, from SoftPress
- Ready, Set, Go! GX International, from Diwan
- LightningDrawGX from Lari Software

Transliteration Issues

There are many methods of transliterating Biblical Greek text into Roman characters. Most of them are quite similar, but differences appear when it comes to consonants such as *phi*, the long vowels *eta* and *omega*, the *iota subscript* and whether and how accents are transliterated. Unfortunately, there is no generally accepted standard throughout the academic community.

The SIL Translation Department has established a set of transliteration guidelines for the use of Greek texts in SIL publications. These guidelines are listed in Appendix D. These fonts are designed to directly support the guidelines, but are also intended to be flexible and useful for other transliteration systems.

The SIL Greek Transliteration Encoding

The SIL Greek Transliteration encoding allows Greek text to be stored in a way that retains all important linguistic information.

Features

- 1) It is an 8-bit (ANSI- or Mac-like) encoding, and so suffers from the same document transfer and compatibility problems between computing platforms as the SIL Composite Greek encoding.
- 2) The ordering of codes is linear, also similar to the SIL Composite Greek encoding, with a single code for each vowel/diacritic combination. Diacritics, such as breathings, *iota subscripts* and accents have their own distinct codes only when used alone, such as before a capitalized vowel.
- 3) The encoding allows all the important linguistic distinctions in the Greek text to be encoded, but only if the SIL Full Transliteration system is used. In this case, texts can then be accurately converted to either of the non-transliteration encodings and viewed using the Greek fonts.

Details

A listing of the access codes used in this encoding and the characters they represent is given in Appendix C.

Extensions

The SIL Greek Trans fonts provide additional glyphs (primarily accented capitals) that are not used in the SIL guidelines and are not part of the SIL Greek Transliteration encoding. If you use these characters in your text, you will not be able to use the conversion routines to convert your text into the SIL Greek Basic or SIL Greek Composite encodings.

Text Conversions

Consistent Changes (CC) is a program that converts flat (non-formatted) documents using a series of commands in a CC table. The CC programming language is very powerful and has been widely used in SIL. The CC tables included here are for the purpose of converting texts between encodings.

Included Tables

<i>Macintosh filename</i>	<i>PC filename</i>
Greek Basic -> Composite	GRBA-CO.CCT
Greek Basic -> Full Trans	GRBA-FT.CCT
Greek Basic -> Simple Trans	GRBA-ST.CCT
Greek Composite -> Basic	GRCO-BA.CCT
Greek Composite -> Full Trans	GRCO-FT.CCT
Greek Composite -> Simple Trans	GRCO-ST.CCT
Greek Full Trans -> Basic*	GRFT-BA.CCT*
Greek Full Trans -> Composite*	GRFT-CO.CCT*
Greek Full Trans -> Simple Trans	GRFT-ST.CCT
Ulysses -> Galatia	ULY-GAL.CCT
Greek Trans 1.2 -> 1.3	TR12-13.CCT

The tables that convert from transliteration to Greek (*) convert the words with word-medial breathings in the Greek NT and the Septuagint (LXX) correctly (e.g. *kagō* becomes κᾰῖγω). However, vowel-initial Hebrew and Aramaic words which are transcribed in the NT or LXX without a breathing gain a smooth breathing when converted (e.g. *Abba* becomes Ἀββα not Αββα).

The Ulysses -> Galatia table (ULY-GAL.CCT) converts text prepared for the SIL Ulysses fonts (as released in Translators Workplace and LinguaLinks) to the current SIL Composite Greek encoding.

The Greek Trans 1.2 -> 1.3 table (TR12-13.CCT) converts text prepared for version 1.2 of the SIL Greek Trans font to the current SIL Greek Transliteration encoding (as used with the SIL Greek Trans fonts version 1.3).

The Consistent Changes programs (for both PC and Macintosh) are available on SIL's web site.

Appendix A — SIL Basic Greek Encoding

The following chart displays every access code allowed in the SIL Basic Greek encoding, the basic character it represents and the ASCII equivalent of that code. The code and ASCII character are displayed below the Greek character. Shaded boxes represent access codes that are not used.

When using the fonts on the Mac OS with WorldScript or QuickDraw GX applications, additional glyphs are available. Most of these are accessed through the modifier access code (124) See chapters on WorldScript and QuickDraw GX for more information.

Appendix B — SIL Composite Greek Encoding

The following charts display every access code allowed in the SIL Composite Greek encoding. When using the fonts with WorldScript or QuickDraw GX on the Mac OS, use of the SIL Basic Greek encoding is recommended — see the chapters on WorldScript and QuickDraw GX.

Access Code Chart for 32-127

This chart displays access codes 32-127, the glyphs they represent and the ASCII equivalent of that code. The code and ASCII character are displayed below the Greek character. This chart is identical to the SIL Basic Greek encoding chart with one exception — the final *sigma* (118). Shaded boxes represent access codes that are not used. When not using an additional keyboard utility, characters can be entered directly by typing the standard keystroke for the ASCII symbol.

Access Code Chart for 128-255

This chart displays access codes 128-255 and the glyphs they represent. These characters are best entered through the use of an additional keyboard utility such as KeyMan or SILKey. Otherwise, Windows users can directly enter characters by holding down the **Alt** key and typing **0** plus the three digit access code. Mac OS users can use standard System 7 keystrokes for entering these characters. These keystrokes are also listed under each glyph in the chart for your convenience. “SOe” means hold down the Shift and Option keys and type “e”. “OuA” means hold down the Option key and type “u”, then release the Option key and type “A” (Shift-a).

Appendix C — SIL Greek Transliteration Encoding

The following charts display every access code used in the SIL Greek Trans fonts. When possible, glyphs share the same access code locations as their Greek equivalents in the SIL Composite Greek encoding. A large number of access codes are left unused as less codes are needed for transliteration than for the SIL Composite Greek encoding. Shaded boxes, if empty, represent unused codes. Otherwise they denote characters that are included in the SIL Greek Trans fonts but are not used in the SIL Greek Transliteration encoding.

Access Code Chart for 32-127

This chart displays access codes 32-127, the glyphs they represent and the ASCII equivalent of that code. The code and ASCII character are displayed below the Greek character. When not using an additional keyboard utility, characters can be entered directly by typing the standard keystroke for the ASCII symbol.

Appendix D — SIL Transliteration Guidelines

The SIL Translation Department has established guidelines for the Roman transliteration of Greek texts in SIL publications. Those guidelines are republished here.

The SIL Greek Trans fonts support both simple and full transliteration systems described below. If you want to be able to convert transliterated text into SIL Basic Greek or SIL Composite Greek encodings, be sure to use the full transliteration system.

SIL Guidelines for the Transliteration of Greek Characters

Revised and updated February 26, 1997

This is intended for use in all SIL publications where transliteration is used instead of Greek script.

Two systems of transliteration are envisaged:

The **simple transliteration system** does not mark accents, *diaeresis* or smooth breathing. This is the system that will usually be used in SIL publications.

The **full transliteration system** reflects *all* the distinctions that are made in Greek script (so that an automatic transfer is possible, either from full transliteration to Greek, or from Greek to full transliteration.)

Transliteration of basic characters

Alpha	a
Beta	b
Gamma	g
Delta	d
Epsilon	e
Zeta	z
Eta	ē <i>(ê may be used if a macron is not available)</i>
Theta	th
Iota	i
Kappa	k
Lambda	l
Mu	m
Nu	n
Xi	x
Omicron	o
Pi	p

Rho	r	
Sigma	s	
Tau	t	
Upsilon	u	
Phi	ph	
Chi	ch	
Psi	ps	
Omega	ō	(ô may be used if macron is not available)

Special combinations with *gamma*

Gamma before a velar consonant is pronounced as a nasal and is transliterated that way.

Gamma-gamma	transliterated as ngg
Gamma-kappa	transliterated as nk
Gamma-xi	transliterated as nx
Gamma-chi	transliterated as nch

Final and non-final forms of *sigma*

In transliteration, both word-final and non-final *sigma* are written as “s”.

Breathings

Breathings occur only at the beginning of a word, on a vowel or rho, and in the case of crasis (fused forms).

A rough breathing with a vowel or diphthong is transliterated as “h” before the vowel or diphthong.

A smooth breathing with a vowel or diphthong is not represented. (Any word-initial vowel or diphthong that does not have a rough breathing has a smooth breathing.)

A rough breathing with a *rho* is transliterated as “rh”, “Rh”.

A smooth breathing with a *rho* occurs very rarely; the combination is transliterated simply as “r”, “R”.

In transliterated text, when a rough breathing occurs with a capital vowel, the “H” will be capitalized, the vowel will not be capitalized.

Iota subscript

Iota subscript may occur under *alpha*, *eta* or *omega*, and occurs in word-final position, with a few exceptions. Transliterated Greek words are very often quoted in the dictionary entry form, and *iota subscripts* occur very rarely in these forms.

In transliteration (simple or full), *iota subscript* appears as in Greek script.

Accent marks and *diaeresis*

Accents are not represented in simple transliterated forms.

In the full transliteration system accents are represented as follows:

acute accent: á

circumflex: â *(this diacritic only occurs over long vowels)*

grave accent à

Diaeresis (two dots) over i or u: ï ü

Accents are not marked, in Greek or in transliteration, over words written entirely in upper case.

In words with initial caps, accents will be placed before the vowel as in regular Greek script, except when rough breathing causes the vowel to not be capitalized. Example:

Ἄφες is transliterated as Ἄphes, but Ἀψαῖς is transliterated as Hápsas

Punctuation marks

In transliterated Greek, use English conventions for punctuation. This applies particularly to the question mark (in transliterated forms use ? as in English, not ; as in Greek) and semi-colon (use ; as in English, not raised period as in Greek).

Appendix E —SIL Galatia Extras Fonts

Additional Greek glyphs not included in the SIL Galatia fonts are available in the SIL Galatia Extras fonts. *Use of these additional fonts, however, will result in text that matches neither Basic nor Composite encoding and requires character by character font information for correct interpretation and display.* You must switch to the SIL Galatia Extras font when you want to use one of these glyphs, then switch back to the SIL Galatia font for the common Greek glyphs. Text that includes these extra glyphs (and the resultant font change information) cannot be easily converted to either encoding and is not supported throughout this font system.

Access Code Chart

The following chart displays every glyph included in the SIL Galatia Extras fonts, the codes used to access them, and the ASCII equivalent of those codes. The code and ASCII character are displayed below the Greek character. Shaded boxes represent unused codes. Characters can normally be entered directly by typing the standard keystroke for the ASCII symbol. *To enter these characters when SILKey or KeyMan is active be sure to disable the Greek keyboards.*

Appendix F — SIL Galatia Glyph Codes

The SIL Galatia fonts actually contain over 430 glyphs. When using the fonts with QuickDraw GX these glyphs become accessible. See the chapter on using the fonts with QuickDraw GX for information on how to use the GX features. One of these features is Direct Glyph Access, allowing access to every glyph without regard to the surrounding context.

To use Direct Glyph Access, enter a backslash (code 092) followed by the glyph code, then select the code (and the backslash) and turn the Direct Glyph Access feature on. To enter the backslash when using the SILKey keyboards type @\ *Note that using this feature will make the text non-standard and unconvertable to either Basic or Composite encodings.*
